

A Simple Aether Sensor

By James P. Shepherd

July 23rd,2016

It is difficult to accept aether energy as a reality, to experiment and play with aether energies if one does not have the ability to sense it or to detect it or to measure it to some degree. This article intends to provide those interested with this ability. Ignorance of the aether will undermine any efforts to understand the universe, in particular gravity and the life force, but would also undermine a true understanding of electricity and magnetism.

My purpose in writing this article is to make you aware that the aether not only exists, it can be sensed, measured (although there is as yet no agreed upon unit of aether), or at least somewhat quantified. Many of you are aware of some of the negative consequences of trying to deliver a greener energy solution for the people of the planet. So am I. There are some profound technologies that have died with their inventors and have been lost to us all. Others believe, like myself, that some inventors have even been killed to prevent their technology from getting out.

I am an inventor and, because I believe important discoveries in the fields of free energy and gravity have systematically been arrested and erased, have worked in secret for over 40 years. However, I am now getting older and care about preserving the few profound things I have discovered and developed. I wrote this article as one of my failsafe mechanisms. In this case a "failsafe mechanism" is a way to preserve information discovered and developed to a certain point and deemed important enough to warrant preservation through public dissemination. An inventor in possession of any kind of breakthrough technology should always maintain a method of preserving that knowledge for others to follow in the event of the inventor's untimely passing or incapacitation. Some discoveries are too important for a community to lose (again and again in some cases).

In April of 2005 I discovered an amazing method of detecting aether energy. I call it amazing because of its effectiveness, simplicity to set up and to use. The energy detected, however, may instead be orgone energy, the zero point energy, the quantum field energy, animal magnetism, odic force, elan vital, ki, qi, ku, chi, vril or prana if those energies are found to be different from aether energy. At any rate, I will use the term "aether" in the remainder of this article to give this energy a common reference term. After all, it is merely a label.

Your purpose in using this simple aether sensor might be because you are a free energy inventor and want to see where, in your apparatus, your energy is manifesting from, maybe even use it to tweak up your free energy output stage; maybe you are trying to charge a new Joe Cell with aether energy and want to know if your water is "charging" before placing it into service or if the type of natural water used is working (try using carbonated water); or maybe you are interested in actually sensing where those natural energy grid points are on the planet yourself like Stonehenge or the pyramid complex at Giza (kind of like a storm chaser – a phi grid-point chaser?); or maybe you are interested in how aether turns into electricity, magnetism, the life force and maybe even gravity; or maybe you want to see which shape, medium material or artifact collects, amplifies or distributes aether energy best; maybe you are testing the efficiencies and capacity of a newly built orgone energy accumulator or orgonite design; maybe you are interested in finding a brain interface or play with

psychokinesis or how the aether energy can effect your own ESP or biological life-form energy (perhaps find a new energy medicine); or to simply detect the aether coming from any spiral shaped weather systems like I describe here, etcetera. I hope you every success and encourage you to share your data with others in your chosen community. Hopefully others might join in the fun of re-inventing our life on tired old planet Earth and learn some profound things in the process.

I am not going to try to justify or argue physics theories here except to state that the infamous Michelson-Morley experiment failed because they designed their entire experiment with the assumption that the aether is stationary. The aether moves. I accept aether as a reality (I already know that it is because I have been monitoring this sensor for years along with other apparatus). This aether sensor is simply too easy to implement, as you will soon see, rather than waste time arguing about it. I am sure there will be issues that surface after this article sees the light of day. Please build the apparatus first, observe it until an arm of a spiral storm passes overhead, watch it as it displays uncommon changes and then returns to normal before offering up your experience with it – negative or positive. A spiral storm (or vortex shaped, or helical shape) is the largest concentration of natural free aether energy that I have sensed so far.

How I believe that the aether sensor actually works is as follows. The aether can move through anything. Some things are better conductors (like copper and gold are good conductors of electricity and iron and nickel are good conductors of magnetism), attractors, or resistors than others to the aether. The aether likewise affects the behavior of some of the things it comes into contact with (like electricity, magnetism and light does). The aether affects the pressure in the air-water barometer differently than it affects the pressure in the CO₂-water barometer. Because of this, the pressure differential between these two barometers becomes an indicator of the amount of local aether energy present.

Shape of the material structure and the materials used as a medium can be themselves energy modifiers to aether energies. So is the kind of substance you employ such as carbon dioxide (CO₂), common air and water. Water, itself is a special material to aether energy. The spiral circulation of water can cause it to attract aether like an antenna, collect and store it too. Glass is a good container/reflector and relates to the optical properties of aether. Many of aether behaviors and dynamics are similar to those stated in some good orgone energy resources available on the internet.

I didn't actually set out to discover aether energy when I put the apparatus together for the very first time. I was looking for a gravitational component that I believed existed in hurricanes. I reasoned that since centripetal force is evident perhaps gravity is an associated component as well. So, I wondered how this force could be generated in a hurricane. So, I imagined the hurricane acting in part like a large centrifuge separating out the gases into layers somewhat like an onion. I happened to think (because I believe that the life force and gravity are fundamental forces that manifest from aether and because CO₂ is prevalent in all life forms) CO₂ as a hurricane component might modify aether into a gravitational force. Perhaps the CO₂ molecules were reactive with air molecules (motion possibly altering the spaces between molecular components) causing a cumulative Casimir-like force to manifest, that might cause a centripetal or even a gravitational effect. Flawed or not, this was my reasoning at the time (April, 2005).

So the following is what I did to test that hypothesis. I separated the components (CO₂ and air) into two storm glasses. Storm glasses are ancient air and water filled barometers open to the atmosphere. I placed them side by side with their stems adjacent to one another so the water levels could easily be compared at a glance. The position and differential of the two water levels in the stems of the storm glasses constitutes an aether gauge. Not knowing what would manifest or even specifically what to look for, I observed them over time. Eventually, (about six weeks) when the levels did reverse positions and the differential of the levels grew I started looking for the trigger for this odd behavior. Over time I eventually realized that the trigger was a spiral storm, more specifically, the abundant free aether collected in a spiral storm.

So, the following is, in some detail, how I made this sensor. I purchased two storm glasses like the ones in the photo. I put air and water in one storm glass that I marked with a permanent marker as "AIR" and put CO₂ and water in the other storm glass that I marked with a permanent marker as "CO₂". The air and water was basically made from tap water. I purchased a 2 liter bottle of carbonated water (also called sparkling water) from the local grocery store. The CO₂ and water was simply made by filling the storm glass by using carbonated water in place of the tap water. I had to add a little more carbonated water to the CO₂ storm glass because it purges some pressurized water up the stem and spills over while the CO₂ storm glass barometer stabilizes (settles down to the point that no more bubbles remain coming from the carbonated water). It would be better if, after stabilization, the water levels were roughly the same but this is not absolutely necessary. I then placed the two prepared storm glasses where they wouldn't be disturbed by anyone with their stems adjacent to one another. Aether goes through everything so it shouldn't matter if it is in a corner or in a basement or an attic or wherever. Avoid situations where one is at a different temperature than the other as a local heat source may affect the pressures and give inaccurate behaviors. Over the years mine has been subjected always to normal living conditions and has always worked reasonably well. I have found also that as time goes by, the better it works. I have run mine for over a year at a time. It is an open system so will still give a reasonable response even if you lose an inch (2 cm) or more of water in the sphere part of the storm glasses (from an initial level in the sphere part of the barometers of about the half way). You can refill them as often as you think that you need or want to though.

You do have to “season” the storm glasses before it will give good results. “Seasoning” entails merely waiting until the two barometers (after both are stable) experience both a high and a low atmospheric pressure cycle. It will be ready to sense the aether after this seasoning period. It is better if you make the levels even (in the stems) during this seasoning process by adding water to the stem of the lower level barometer. Also, it is important that the stem water levels not get so low as to allow air into the base of the sphere.

So here is what you should see. After the CO₂ stabilizes both individually perform as bona-fide barometers (because that is their prime function). What you do is monitor the water levels in the stems and compare the water levels there against one another. You will notice that one will follow the other fairly consistently. I suppose if one gets the levels bang-on initially, they could be even after stabilization but mine was never dead-even during the majority of the time. This differential of stem levels is how you gauge the aether energies present after the water levels are seen to reverse their positions in the stems. When these levels reverse their positions, that indicates that higher than normal aether energies are present by the amount as indicated by their distance apart. I have found that certain spiral based energetic shapes (such as spiral shaped storms – the ones with arms -or even a single arm- like a spiral shaped galaxy) cause this peculiar behavior in the storm glasses.

I should also mention one other natural incident that caused this behavior in the storm glasses (the reversal of stem water levels). The only thing that was spiral shaped during the

6 or 7 days that the storm glasses displayed this behavior then was a spiral alignment involving the planets and sun. Their positions for the 6 or 7 days formed a spiral as depicted by the orrery software I was using at the time.

I live on Vancouver Island off the coast of BC, Canada. Here we have some spiral (technically vortex shaped) type storms like that from the Pacific ocean sometimes and over the years I was able to observe the sensor (storm glasses) in action and learn its behavior fairly well while also using it to experiment with (to detect aether energies from any aether energy generating devices that I tested). I have since built other sensors based on this differential of storm glass pressures complete with logging and graphing capabilities. I used micro-controllers and home-made software to monitor these modified storm glass vessels before I realized that there was an off-the-shelf solution that one could buy instead of going through the painstaking path of building your own. That off-the-shelf solution discovered was in buying a "differential manometer" with dual inputs and logging capabilities. If you go this route, you need to access the sphere atmosphere in the storm glass (a somewhat tricky thing to do). You only need one storm glass to access the CO₂ atmosphere because the differential manometer supplies the "normal" air pressure reading just by leaving one gas input open to the air. I ended up making my own storm glasses out of an inverted round-bottom flask with a two hole stopper to allow the passage of a stem and of a pressure sampling tube that I attached to one side of the differential manometer. If you want to buy a differential manometer, make sure it can read 15 psi (pounds per square inch) as standard air pressure is about 15 psi. Also, make sure it has a computer interface cable and that it has adequate software to monitor, log and graph your data. A wall wart style power supply is nice too to prevent your batteries from expiring and unexpectedly stopping your data collection. You won't need fast sampling to monitor spiral storm data but you do if you try to generate aether waves depending on your source or to locate other unknown sources of aether also depending on the source under investigation. For instance, if I was trying to sense UFOs passing by I would want a sampling rate that would be at a very high rate of samples per second.

This simple sensor tells us what things are essential to aether energies. CO₂ is revealed to be a very active ingredient to attract aether energy like an antenna for aether. CO₂ is also essential to all life forms indicating aether is the driving energy behind the life force. Spiral shapes seem to act as an attracting antenna for aether also. Shapes like pyramids seem to be also antenna-like to aether energies. I believe that aether can be regarded as a fundamental energy like electricity and magnetism. Knowledge of the aether can yield untold helpful technologies for the human race on planet Earth.

Surprisingly, information regarding other technologies that have emerged and that have since disappeared or have been suppressed have also used these materials in like fashion to that of this simple aether sensor.

Ancient pyramids employ the very key materials that this sensor does. Very similar to the design of a simple storm glass barometer is the design of the common central subterranean chamber and passageway found in many (dare I say all) ancient Pyramids. Some Egyptian pyramids that are known to have this subterranean central chamber and passageway (akin to the sphere and stem in storm glasses) are Zoser's Step Pyramid at Saqqara, the Meidum Pyramid, the Bent Pyramid of Dahshur, the Red Pyramid at Dahshur, Khufu's Pyramid at Giza (aka. The Great Pyramid and Cheops), Khafre's Pyramid at Giza and Mankauere's Pyramid at

Giza. Interestingly, these pyramids are found adjacent to the Nile river water source to facilitate easier operation of these aether energy-collecting pyramids. Pyramids have some common denominators that should be mentioned in the light of these identified dynamic materials, particularly CO2 and water used as described in this simple aether sensor. Even this simple aether sensor has shown us that carbon in the form of CO2 primarily is a basic essential active ingredient to this aether technology. The carbon inherent in limestone in vast proportions in the larger pyramids probably helps to amplify this collected aether also.

8 Sections of the seven large pyramids of the Old Kingdom, drawn to the same scale. A Zoser's Step Pyramid at Sakkara, showing the successive building phases (cf. fig. 9 and p. 49). B The ruined pyramid of Amenhotep with Petrie's reconstruction of its three building phases (cf. fig. 36). C and D The "Bent" (southern) Pyramid of Dahshur. E The "Red" (northern) Pyramid of Dahshur. F Khafu's pyramid at Giza, showing Borchardt's conjectured internal business walls. G Khafu's pyramid at Giza. H Menkaure's pyramid at Giza.

Were people like the Egyptians building these pyramids to generate elevated life energies using concentrated aether energy collected by the Pyramids? Did the water in the pyramids super saturate with aether energy then emit as life energy through the pyramid prism (stone, like almost everything else is nearly transparent to aether energy)? Prisms also demand polished surfaces like the pyramid exterior surfaces used to be. Could they rejuvenate their bodies and be made young again using this manufactured supplemental life force? Is this what caused the ancients to live hundreds of years? Immortality? Was aether energy used to create the gravity energy needed to float the stones into position by levitation?

How can we reactivate pyramids? The investigations of many ancient pyramids reveal a common feature. Pyramids have a central base chamber (commonly called a subterranean chamber) with a passageway leading from the bottom part of the chamber to the exterior above the base (very similar in design and function to the sphere and stem of the storm glass).

If we were to fill that passageway with water, the chamber would fill to the height of the top of the passageway in the chamber creating an "air pocket" in that chamber (just like it does in the storm glass). It would become very humid in this air pocket creating an humid atmosphere of evaporating water that would repeatedly condense onto the limestone surface in the upper part of the chamber. Upon this water vapor touching the walls and ceiling of the chamber water vapor will condense causing water to make contact and run down the walls back to the lower liquid surface of the trapped reservoir. Capillary action of the limestone will draw the condensed water vapor into the limestone walls and ceiling. The chemical constituent of limestone is calcium carbonate (CaCO_3). When calcium carbonate and water mixes like this it naturally outgasses CO_2 . So that the air pocket becomes saturated with CO_2 much like the sensor does as described above making the air pocket into a CO_2 and water vapor atmosphere. Aether is attracted to that gaseous CO_2 and water vapor mixture. Aether is absorbed into the water by the condensation action of the aether-charged CO_2 and water vapor mixture and then radiates itself after super-saturation of the aether into the chamber water. The aether energies, like properties of light, then propagates through the shape of the pyramid and is modified by the pyramid shape much like the way light is modified by a prism. In this way the aether is output directly from the pyramid into the adjacent atmosphere.

If life force is the output, I will assume the frequency of the modified aether is resonant to the life force in humans and helps to regenerate people living nearby (maybe for hundreds of miles distant). It makes me wonder if there is an element of truth behind the legends of a "fountain of youth". In ancient times there were giants on the Earth too, that may have been a side effect of their early longevity technology. Did they evolve their energy medicine technology through to a working longevity technology through to an immortality technology? Interestingly, boat pits have been found as a part of pyramid complexes. The perimeter walls of those complexes may have been used to create a man made lake around some of the pyramids (where the boats were found). Common to these complexes is also a structure in between the complex and the Nile river. Was this used to fill the man-made lake around the pyramids?

Also, the pyramids seem to always be oriented to the cardinal points of a compass. Could that be because generally aether flows from west to east? In this orientation the prism-like face would interact with the maximum amount of aether flowing through the face. This west-east aether transit begs the question: does the aether cause or contribute to Earth's rotation?

I should also mention that this CO_2 gas and water mixture that was used for aether attraction and storage of the aether energies in the pyramids was also utilized by another technology. Wilhelm Reich utilized these components in his famous cloud-buster technology. He invented the term "Orgone" energy, but we refer to it as aether energy in this article. He would channel aether energy from clouds into the waveguide pipes that were attached to CO_2 and water mixture inherent in local natural water such as streams and underground water sources. So,

one end of his waveguide pipes would hold a CO₂ atmosphere. The other end of the waveguide pipes you would aim at a cloud. It stole the cloud's energy and dissolved the cloud. Is the cloud's energy aether? Was it attracted and absorbed by the CO₂ and water atmosphere in the local water source at the end of the waveguide pipes? Also, story goes that when he aimed the cloudbuster at two UFOs it made their lights dim and shimmer. This version of the cloudbuster he named his "spacegun". Shortly after this (1954) the U.S. Food and Drug Administration threw him in jail where he died.

Another suppressed technology employing water, CO₂ and spiral shapes was discovered/invented by Viktor Schauberger. He made natural water form into spirals (artificial rapids) as it moved. Most, if not all, natural waters contain some quantity of CO₂ in the form of dissolved gas. He found that the life energy grew in power by recirculating the water in spiral paths utilizing rapids. The CO₂ in the natural water spirals attracted aether and the water collected and stored it. With this technology he was able to purify and enliven water with the life force. Interestingly, the Nazi Bell (Die Glocke) during WWII was powered with an antigravity engine that supposedly was a derivative of Schauberger's implosion technology (the Schauberger Repulsine).

Yet another suppressed invention of late is something called a Joe Cell. A Joe Cell is a stainless steel pot with nested stainless cylinders and water placed in it. The experimenters go to great lengths to use the right kind of "natural water" to place into it before connecting the center electrode with negative direct current and connecting the pot to positive direct current. After 30 seconds of charging with direct current electricity an orgone (aether) energy is supposed to develop and regenerate itself to the point of running an internal combustion engine in a car on it. The aether is channeled into the carburetor where it is from that point (and in an undisclosed concentration) used like gasoline, except that the timing is altered to leverage implosion instead of the traditional explosion of gases in the engine cylinders. Water would evaporate and condense in the cell during this process giving the water movement. In Joe Cell technology, the burning of concentrated aether yields implosions that suck the pistons upwards driving the engine. Interestingly too, there is a legend of Joe's car exhibiting a slight levitation on at least one occasion.

Sentience. Anyone interested in AI (artificial intelligence) might explore the aether because the aether, at times, has exhibited sentience. Dowsers ask the aether how deep is the water and the aether (through the wands) answers. Joe Cell enthusiasts are sometimes plagued with a non-cooperating charging force unless they perform some kind of ritual that they feel it wants. Perhaps this sentience can be explored further to yield a new artificial mind. Sometimes intelligent aether is in the root of knowing a thing that isn't logical to know. When it doesn't make sense to know a truth or a lie we say that we "feel" something is true as in "it rings true" but in that statement we are trying to come to terms with the kind of knowing that has no apparent evidence or reason.

There is a possible secondary use of this aether charged water. Tesla has demonstrated that his aether energies caused light, heat in addition to a state of well being (Tesla used his generated aether energies to make himself feel well) depending upon the pps (pulses per second) or pulse rate he was using. He could light up a room or warm it to his liking. There are possible other ways to achieve this condition without the electrical oscillations that Tesla commanded. The aether, according to Tesla, behaves like a super fine gas. If it is fine enough, I believe that it can be modified to oscillate with some things that it passes through.

The lattice structure of various crystals should be able to modify its frequency similar to the relationship of a cavity/waveguide to microwaves does. It should be able to do this without electrical or magnetic dependence. Is that what the ancient crystal skulls that have been found world wide did to the aether energies? Was this charged aether water bottled and sold to the citizens of old like we sell and distribute batteries for special appliances to provide heat, light and whatever else it can do?

No aether subject however would be complete without mention of its most prevalent “shape or form attractor”: the spiral and its three dimensional variants, the vortex and the helix. I like to call this attraction of the aether “spiral resonance”. In the natural world these shapes attract aether energy and subtly convert them into child energies of electricity (as in tornadoes and hurricanes and vortex shaped storms), magnetic field swirling, life energies (as in DNA, fractal-like spiral constituents of many plants, seashells, claws, horns and many other biological structures great and small), gravity (spiral galaxies, precession of planets with the pull of natural satellites), etcetera.

An important take-away message from this simple aether sensor is that carbon dioxide is a dynamic aether material that ultimately may alter other energies and matter in unnoticed and unpredictable ways on our planet. Our accumulated primary green house gas is carbon dioxide. The more CO₂ we release into our atmosphere, the more effects we can expect to experience. At the very least I expect we can experience stronger, more energetic hurricanes and tornadoes. It can also, however directly affect life on our planet, earth's magnetism and electric field and maybe even Earth's gravity. Tesla has demonstrated that electromagnetic energy can alter the aether. With so much electromagnetic pollution generated by cell phone towers, electrical distribution lines, wifi, etc. of our modern society we are constantly bathed in a sea of electromagnetic radiation, I have to wonder what it is doing to the aether energies called Life Force within all of us. There seems to be chronic disease everywhere.

I know that what I offer is a ridiculously simple aether sensor. No tools are required to use it. However, it is true. It offers us all a window into a world we should have already progressed into in terms of awareness and technologies. This simple sensor is to aether in the way that the galvanometer was to electricity. Now that we have something that responds to the aether, we have a chance of rapid development in many areas. More sophisticated, sensitive versions could probably even sense life forces in lifeforms and probably sense earlier beginnings of tornadoes and hurricanes that may provide for earlier warning systems. Now that we can identify aether energies, maybe we can all participate as pioneers giving birth to a profound aether science and helpful aether technologies that replace the polluting technologies that are prevalent today. I think there exists an easy path to a gravitational technology through aether as well. Maybe instead of the “electrogravitics” of Thomas Townsend Brown we will soon be developing an “aethergravitics” technology. This and the relationship between aether electricity and magnetism I intend to explore further. I hope that you do too.

I am hopeful that aether science and technologies will develop as “open source” so that we may all benefit from its development and not hinder or obstruct it through a single entity “ownership” of the aether. I am also hopeful that when strong aether locations are identified that we keep those locations open for public use worldwide and not be secured for the exclusive use of military, government or corporations.
